

## SEARCH REQUEST FORM

Scientific and Technical Information Center

Requester's Full Name: ZALIKOVA, TATYANA Examiner #: 76608 Date: 4/10/03  
 Art Unit: 1713 Phone Number 303-28819 Serial Number: 09417679  
 Mail Box and Bldg/Room Location: CP3 8E16 Results Format Preferred (circle): PAPER DISK E-MAIL

If more than one search is submitted, please prioritize searches in order of need.

\*\*\*\*\*

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: See attached

Inventors (please provide full names): " " "

Earliest Priority Filing Date: 108/01/2000

\*For Sequence Searches Only\* Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.

Compound of claim 3, wherein R<sub>2</sub>  
 can be other than stated in claim,  
 but should comply with the formula:

Thank you very much.

T. Z.

AB The polyester [e.g., poly(ethylene terephthalate), polyethylene-2,6-naphthalene dicarboxylate] film for a digital recording-type magnetic tape, etc., has a coating layer contg. binder resins, inert particles, and surfactants comprising (A) 0.5-15% (based on coating layer wt.) primary surfactants having HLB value 10-14 and (B) 1-10% secondary surfactants having HLB value 16-20. The other side of the film may be coated with a layer contg. cellulose derivs. and surfactants. A magnetic recording medium consisting of the coated film, a magnetic layer (e.g., ferromagnetic metal film) on the former coating layer, and a back coating layer on the other side of the film, is also claimed.

Section cross-reference(s): 35

AB Recycling of poly(ethylene terephthalate) PET waste by chem. methods is a well-known process that generates value-added products. Depolymn. products of PET recycling were commonly applied as starting materials for the synthesis of polyurethanes, satd. and unsatd. polyester resins. In

this current work we are reporting on a novel application of the depolymd. products obtained by glycolysis of PET by converting the hydroxyl functional groups to methacrylate groups. The obtained methacrylated oligoesters were tested for UV curability by UV irradiation, in the presence of 2-benzyl-2-dimethylamino-1-(4-morpholinophenyl)-1-butanone (BDMB) as a photo initiator. This gave cured films of high mech. properties when these methacrylated oligoesters were either cured alone or as mixts. with other com. available diacrylate/dimethacrylate monomers. The measured tensile properties were in the range of 7.21-43 MPa for max. tensile strength and 0.90-3.0 GPa for Young's modulus.

AB	The polyester film, useful for digital video tapes, has at least on one side a layer with a surface microstructure comprising concave and convex lines with width 0.1-3 .mu.m, wherein the layer with surface roughness Ra (measured by AFM) 3-20 nm contains inert microparticles with av. diam. 10-200 nm. The layer may be deposited on a back side of a magnetic tape. Thermal distortion in vapor deposition of magnetic layers is prevented with the films.

Section cross-reference(s): 77
- AB PET waste obtained from beverage bottles was depolymerized by a glycolysis reaction, using diethylene glycol (DEG) as the glycolyzing system and manganese acetate as a transesterification catalyst. The glycolysis reaction was conducted at two different molar ratios of PET:DEG, namely 1:2.15 and 1:1.03, for the sake of obtaining oligoester polyols of varying mol. wts. The hydroxyl values of the obtained oligoesters were 361 and 330 mg KOH/g. Modification of these oligoester polyols was carried out by acrylation reactions of the available hydroxyl groups by acryloyl chloride. This gave acrylated oligoesters curable under UV or electron beam irradiation. The curability of these newly synthesized acrylated oligoesters was tested by UV irradiation, in the presence of 2-benzyl-2-dimethylamino-1-(4-morpholinophenyl)-1-butanone (BDMB) as a photo initiator. This gave cured films of high mech. properties when the acrylated oligoesters were either cured alone or as mixts. with other com. available diacrylate/dimethacrylate monomers. The measured tensile properties were in the range of 4.62-45 MPa for max. tensile strength and 0.074-2.0 GPa for Young's modulus.

Section cross-reference(s): 77

AB The investigation on synthesizing new UV curable acrylated oligoesters, initially derived from PET waste, for the solventless magnetic tape manufg., was successfully established. Methacrylated oligoesters obtained by glycolyzing PET with diethylene glycol (DEG) at the molar ratio of PET:DEG (1:1.03) showed better mech. properties than those results obtained by glycolyzing PET at the molar ratio of PET:DEG (1:2.15). The idea of the current investigation is a novel one and it opens the door for many new applications for the oligoesters derived from PET waste.

AB A title polymer is manufd. by (A) prepg. a prepolymer by radical polymn. of (a) styrene or styrene derivs. (structures specified) with (b) (meth)acrylate esters, (meth)acrylonitrile, (N-substituted) (meth)acrylamides, maleic anhydride or maleamide, (c) OH-contg. (meth)acrylates, and (d) bifunctional comonomers as crosslinking agents, and (B) reacting the prepolymer A with a polyol, polyester or polyamide and an aliph. or arom. di- or polycarboxylic acid, ester or anhydride. The resulting polymers are then blended with pigments to give electrophotog. toners. For example, a prepolymer prepd. by radical polymn. of 1,4-butanediol monoacrylate, Bu methacrylate, di-Me terephthalate, divinylbenzene, neopentyl glycol and styrene was combined with neopentyl glycol and di-Me terephthalate, the mixt. was heated with

- Fascat 4100 catalyst and the resulting crosslinked polymer melt-blended with Neopen Yellow 075 to give a title toner.

AB	Nanocomposites are manufd. by combining a host material, such as an org. solvent or a matrix polymer and exfoliated intercalates formed by contacting a phyllosilicate with an intercalant selected from the group consisting of (1) an N-alkenyl amide monomer and an allylic monomer; (2) an oligomer formed by copolyng. an N-alkenyl amide monomer and an allylic monomer; (3) a polymer formed by copolyng. an N-alkenyl amide monomer and an allylic monomer; and (4) mixts. thereof to adsorb or the intercalant between adjacent phyllosilicate platelets. Sufficient polymer is adsorbed between adjacent phyllosilicate platelets to expand the adjacent platelets to increase the spacing at least about 10 .ANG., preferably at least about 20 .ANG. (as measured after water removal), up to about 100 .ANG. and preferably in the range of about 30-40 .ANG., so that the intercalate easily can be exfoliated, e.g., when mixed with an org. solvent or a polymer melt, to provide a carrier material for drugs and the like, or to provide a matrix polymer/platelet composite (nanocomposite) material--the platelets being exfoliated from the intercalate.

AB	The title paint binder compn. for matte powder coatings on wood or wood fiber, plastics, etc., comprises a resin and optionally a crosslinker and photoinitiator, in which >0.5 mol % (based on the total amt. of polymerizable unsatn. of the binder) results from itaconic acid ester units. The polymer can be a polyester, a polyacrylate, a polyolefin or an addn. product of epoxy resins and itaconic acid. The paint compn. is storable at <40.degree. and exhibits good flow at 60-200.degree.. Thus, wood fiber panels were coated with a powder compn. contg. a polyester (acid value 7.6 mg KOH/g, OH value 61 mg KOH/g, glass transition temp. 40.degree.) of itaconic acid, neopentyl glycol, terephthalic acid, and trimethylolpropane, a crosslinker Uralac ZW 3307P, Irgacure 184, and flow aid BYK 361 and cured with a UV lamp (1 J/cm2) to give coated panels with acetone resistance and 20/60.degree. gloss 7/1.

AB The dispersions useful as water-based marking and recording or printing inks, coatings, etc., are prepd. by dispersing fine pigmented or/and dyed particles contg. mainly polyesters in medium contg. mainly water to the substrate consistency S and dispersion viscosity .eta.i (in cPs at 20.degree.) in such a way that {log(.eta.i)-log(.eta.0)}/([S]2).gtoreq.5 (provided that 0.05.ltoreq.S.ltoreq.0.5 and .eta.0 is the viscosity of medium) for reducing feathering and smearing and clogging of delivery tool nozzle. Thus, dissolving 200 parts a polyester derived from di-Me isophthalate, di-Me terephthalate, di-Me 5-sodiosulfoisophthalate, neopentyl glycol and ethylene glycol in MEK 100 and THF 50 mixed solvent contg. T-77 dye 14 parts at 70.degree., adding the soln. to 500 parts

water at 70.degree., mixing and distg. until a fraction having b.p. 103.degree. is reached gave an aq. dispersion having .eta.i 4.2, .eta.0 1.7, S 21.0%, and good ink performance.

ST colored polyester waterborne ink dispersion; marking ink aq polyester dispersion; coating waterborne polyester dispersion; smear resistance aq polyester ink; recording ink waterborne polyester dispersion; printer ink waterborne polyester dispersion; feathering resistance aq polyester dispersion

- AB The recording material has a magnetic layer contg. a polyurethane having a structure  $\text{OCOCR}'\text{HCH}_2\text{ACH}_2\text{CR}'\text{HCO}_2$  [I; A = N+RR<sup>3</sup>.X-, A1, A2; R = (substituted) alkyl, aryl, aralkyl; R' = H, alkyl; R1, R2 = alkylene; R3 = alkyl; X- = anion], which is preferably obtained by treating an org. diisocyanate with a long-chain polyols contg. I (A = NR, A3) and an optional chain-extending agent, followed by reaction with an alkylating agent to quaternize the tertiary amino group to quaternary one. Magnetic powders in the magnetic layer showed good dispersibility and dispersion stability in the polyurethane binder.

- AB Title films are obtained by applying aq. coatings contg. antistatic polymers (prepd. by polymg. thiophene and/or thiophene derivs.) on .gtoreq.1 side of polyester films, drying, and stretching [surface resistivity of the coating film (SR) 105-1012 .OMEGA./square]. Thus, a poly(ethylene terephthalate) undrawn film was stretched 3.5 times lengthwise, coated with a compn. contg. an antistatic polymer [prepd. by doping 24 parts p-styrenesulfonic acid homopolymer (27 mol% ionized) in 14 parts copolymer I] 38, 5:3:5:92:37:4:54 (mol) adipic acid-1,4-butanediol-diethylene glycol-ethylene glycol-isophthalic acid-Na 5-sulfoisophthalate-terephthalic acid copolymer 35, and 14:45:7:3:3:32 Et acrylate-Et methacrylate-glycidyl methacrylate-2-hydroxyethyl acrylate-N-methoxymethylacrylamide-Me methacrylate copolymer 15, poly(vinyl alc.) 2, and ethylene oxide-propylene oxide block copolymer 10% on one side of the film, dried, and stretched 3.9 times crosswise to give a laminated film having SR = 1.5 .times. 1011 .OMEGA./square, good back-transfer resistance, and good ink-bonding properties.

- AB A water-sol. org. oligomer(s) is grafted onto an org. polymer(s) in aq. latex form by free-radical polymn. of .gtoreq.1 monomer in a water-based mixt. of a water-sol. oligomer(s) and an aq. latex of a polymer(s). The extent of grafting is easily controlled. The products exhibit better response to associative thickeners (e.g., in paint formulations), coating compn. open time, and coating film properties than blends of the corresponding oligomer(s) and the polymer(s). A typical grafted product was manufd. by free-radical polymn. of Me methacrylate (I) in a mixt. of a 28.1% aq. 20:80 methacrylic acid-I copolymer soln. and a 45% solids 5:20:50:25 acrylic acid-Bu acrylate-Bu methacrylate-I copolymer latex.

AB	The binder resin, which may have a softening point of 95.0-170.0.degree. and a glass transition point of 50.0-80.0.degree., comprises a fluoromica of .alpha.MF..beta.(aMgF2.bMgO)..gamma.SiO2 (M = Na, Li, K; .alpha. = 0.1-2; .beta. = 2-3.5; .gamma. = 3-4; a, b = 0-1, a + b = 1). The fluoromica may be obtained by heat-treatment of mixed micropowders of 10-35 wt.% of M2SiF6 (M = Na, Li, K) and talc. The toner compn. contains the electrophotog. binder resin, colorant and charge controlling agent. In the manuf., the fluoromica is added in the synthetic process of the binder resin. The binder resin shows good chargeability, transparency and low-temp. fixability.

AB The title toner contains a binder resin obtained by copolymn. of an unsatd. polyester and vinyl monomers including a multifunctional vinyl monomer(s) 0.01 - 5.0 wt.% relative to the total amt. of vinyl monomers used. The unsatd. polyester may incorporate an aliph. unsatd. dibasic acid(s) 0.2 - 5.0 wt.% and have no. av. mol. wt. 500 - 10,000. This toner shows good fixability and improved resistance to offset.

AB Title polymers, useful for coatings on polystyrene substrates, are prepd. by polymg. (meth)acryloyl-contg. diols, high-mol.-wt. diols, chain extenders, and diisocyanates and grafting (meth)acrylate esters on the resulting polymers. Thus, glycerol methacrylate 2.56, adipic acid-dimethyl terephthalate-ethylene glycol-neopentyl glycol copolymer 403.3, 1,4-butanediol 18.7, MDI 100, dibutyltin dilaurate 0.3, MEK 600, and toluene 624 parts were heated at 70-80.degree. under N to give a polymer with no.-av. mol. wt. 20,000 and methacryloyl content 2 mol%, 300 parts of which was heated with 90 parts iso-Bu methacrylate and AIBN in MEK at 70.degree. and dild. with MEK to 30% solids. The soln. with viscosity 230 cP was storage-stable and formed a transparent film on a polystyrene sheet with good adhesion.

AB	The title binders having good compatibility with magnetic powders and low viscosity for good workability and leveling and forming abrasion-resistant coatings with excellent magnetic characteristics were described including various acrylic-terminated polymers (contg. urethane, urea, amide, and/or ester linkages) of mol. wt. 2000-100,000. Thus, a mixt. of methylenebis(4-cyclohexyl isocyanate) 71.9, dibutyltin dilaurate 0.2, and MEK 300 g at 60.degree. was treated with a mixt. of 125.6 g Teracol 650 and 15.5 g Epikote 828 diacrylate, stirred at 60.degree. for 4 h, treated with 9.6 g pentaerythritol triacrylate at 60.degree. for 2 h, and treated with 77 g HOZQZQZOH (Z = polyoxytetramethylene; Q = pyromellitic acid residue) at 60.degree. for 7 h to give an electron beam-curable binder resin.

LA English  
CC 35 (Synthetic High Polymers)  
AB Two methods for the prepn. of polyester methacrylates are described: (1) Methacrylation of hydroxy-contg. oligoesters obtained by the

reesterification of the esters of alcs. and polyhydric acids with polyhydric alcs. Terephthalic, furan-2,5-dicarboxylic, and benzylphosphonic polyester methacrylates, which cannot be obtained by means of condensation telomerization, are synthesized by this method. (2) Addn. telomerization of mixts. of epoxy compds. with anhydrides of methacrylic and polyhydric acids. A closer study of this reaction revealed that it permits the prepn. of a wider range of polyester methacrylates than does condensation telomerization. The three-dimensional polymn. of some of the synthesized polyester methacrylates was investigated.
